These data are for tutorial use in learning the Correlated Walk Analysis routine described in Chapter 12. The coordinate system is longitude, latitude (spherical). The sample data include four data sets:

1. PredictableOffender1.dbf – the first theoretical offender described in Chapter 12.
2. PredictableOffender2.dbf – the second theoretical offender described in Chapter 12.
3. RealOffender1.dbf – a real offender who committed 12 offenses, arranged in sequential order. You can use the first 11 to predict the 12th offence. While these data were originally from a real offender, random spatial error has been added to the coordinates.
4. RealOffender2.dbf – a real offender who committed 15 offenses, arranged in sequential order. You can use the first 14 to predict the 15th offence. While these data were originally from a real offender, random spatial error has been added to the coordinates.
