## ABCD Study® Aims

1. Describe individual developmental pathways:  
Neural, cognitive, emotional, academic
2. National standards of healthy brain development
3. Interaction of genes and environment on development
4. Influences on brain development: Physical activity, sleep, screen time, traumatic brain injuries
5. Influences on mental health from childhood to young adulthood
6. Relationships between mental health and substance use
7. Substance use influences on developmental outcomes

[P: parent; Y: youth; G: geocoding; v1, v2: ABCD visit]

## ABCD Brief Delinquency Measure items

Items from Self Report of Delinquency: Loeber et al. 1989

Have you hit someone with the idea of hurting them... [**assault**]

Have you been loud, rowdy, or unruly in a public place...so that  
people complained about it or you got in trouble [**disorderly**]

Have you **thrown objects** such as rocks or bottles at people...

Have you purposely **damaged** or destroyed **property that** did not  
belong to you...

Have you taken something from a **store** without paying for it...

Have you stolen or tried to steal things worth **\$5 or less**...

Have you stolen or tried to steal things worth between **\$5 and \$50**...

Have you carried a hidden **weapon**...

Have you been involved in a **gang fight**...

Have you been arrested or picked up by **police**...for other than minor  
traffic offense

**Qualifier:** "...in the past year?" **Response options:** yes or no; # times

Piquero et al. (2002) The validity of a Self-Reported Delinquency  
Scale. Sociological Methods & Research 30(4), 492-529

## ABCD BDM (v2 Y) psychometric analyses

Item	Rate (%)	EFA factor loadings	IRT $\beta$	$\alpha$
assault	9.3	.61	2.1	1.4
disorderly	4.4	.57	2.7	1.5
thrown object	3.2	.69	2.5	2.0
property damage	1.9	.73	2.6	2.3
store theft	1.6	.88	2.5	3.1
theft <\$5-\$50 <sup>1</sup>	1.4	.84	2.5	2.8
weapon	1.0	.66	3.3	1.9
gang fight	1.0	.68	3.1	2.2
police	0.3	.68	3.6	2.3

ABCD Visit 2: n=11235; 1. theft <\$5 & theft \$5-50 combined

EFA: Exploratory Factor Analysis, tetrachoric matrix

Eigenvalues: 4.9, 0.9, 0.8, 0.6, 0.5

IRT:  $\beta$ : difficulty or severity;  $\alpha$ : discrimination

## ABCD BDM: Differential Item Functioning

### Candidate Items: Qualitative review: disorderly, police

Have you been loud, rowdy, or unruly in a public place...so that people complained about it or you got in trouble  
[disorderly]

Have you been arrested or picked up by **police**...for other than minor traffic offense

**BDM 10 items x BDM 8 items:  $r=0.95$  ( $n=11,311$ ;  $p<.001$ )**

### DIF statistical analyses

DIF: a statistical characteristic showing an item may be measuring different “abilities” in identified subgroups

Sequential DIF flexMIRT analysis conducted

## ABCD BDM DIF thresholds by race

Item	white $\beta$	black $\beta$	p
assault	2.20	1.76	0.12
disorderly	3.17	2.10	0.44
thrown object	2.62	2.29	0.03
property damage	3.02	2.24	0.28
store theft	2.70	2.02	0.89
theft <\$5-\$50 <sup>1</sup>	2.63	2.19	0.39
weapon	3.32	2.68	0.03
gang fight	3.47	2.69	0.03
police	3.74	3.16	0.009

**disorderly:** no significant differences  
**police:** black youth showed lower “difficulty”

flexMIRT DIF analysis; DIF:  $\beta$ : difficulty or severity

## ABCD Higher Risk Index (HR) & KSADS: parent at ABCD v1

HR items derived from Loeber et. (2018) & anxiety/depression/protective

HR Item	GAMM <sup>1</sup> (n=4479)		
	F	p	$\Delta R^2$
lie or cheat	17.2	<.001	0.8%
property	26.0	<.001	1.2%
disobey	54.1	<.001	2.4%
steal	21.2	<.001	0.9%
Household smoke	12.7	<.001	0.3%

	ANOVA <sup>2</sup> (n=11,235)	
<b>ABCD HR<sup>2</sup></b>	26.9	<.001
<b>KSADS ADHD</b>	32.7	<.001
<b>KSADS ODD</b>	48.9	<.001
<b>KSADS CD</b>	75.8	<.001

1. ABCD NDA 2.0: DEAP GAMM:

Fixed Effects: age/sex/race/ethnicity/income/marital status

Random Effects: family/site

Propensity weight: American Community Survey

2: ABCD NDA 3.0: ANOVA: covariates: age/sex/race/ethnicity/income

## ABCD UPPS (Yv1) x BDM (Yv2)

**UPPS-P Short Youth Version:** impulsivity as a multi-faceted, multi-dimensional construct with five impulsive personality traits; 4 items per scale [4-point: agree strongly ... disagree strongly]

Subscale	ANOVA <sup>1</sup> (n=11,235)		GAMM <sup>2</sup> (n=4473)		
	F	p	F	p	$\Delta R^2$
Negative Urgency	15.9	<.001	62.7	<.001	1.4%
Positive Urgency	12.5	<.001	63.0	<.001	1.4%
Lack of Perseverance	17.4	<.001	47.8	<.001	1.1%
Lack of Planning		9.0	<.001	99.6	<.001
		2.2%			
Sensation Seeking	2.9	.001	16.3	<.001	0.3%

[1: ABCD NDA 3.0: ANOVA: covariates: age/sex/race/ethnicity/income]

[2: ABCD NDA 2.0: Data Exploration and Analysis Portal GAMM:

Fixed Effects: age/sex/race/ethnicity/income/education/marital

Random Effects: family/site

Propensity weight: American Community Survey

Reference: Watts et al. (2019) ...UPPS-P... Psychological Assessment

## ABCD Life Events (Pv2) x BDM (Yv2)

## PhenX Life Events: parent at ABCD v2 (n=11,235): “ever”

	% yes
Example items: youth was victim of crime or violence	1.4
someone in family arrested	5.6
caregiver went to jail	3.5

	ANOVA <sup>1</sup>	
	F	p
<b>Life Events</b> Pv2: adverse sum	2.1	.008

## The Traumatic Life Events Questionnaire

Kubany et al (2000) Psychological Assessment

1. ABCD NDA 3.0: ANOVA: covariates: age/sex/race/ethnicity/income

# ABCD KSADS PTSD trauma items (Pv1)

**KSADS trauma history items:** parent at ABCD v1 (n=11,878):

**17 traumatic events:** present/past (“yes” 1%)

Example items: parent about youth history

## ***More frequent events***

24% Unexpected death of loved one

8% Witness grownups in home push, shove or hit one another

4% accident requiring medical attention

## **Less frequent events** (yes $\leq$ 1%)

witnessed someone shot or stabbed in the community

shot, stabbed or beaten by non-family member

shot, stabbed, or beaten by grown up in the house

family/non-family member threatened to kill your child

sexual abuse (3 items)

Kauffman et al. (1997, 2000) Schedule for affective disorders and schizophrenia for school-age children (K-SADS-PL). JAACAP 36(7); 39(10)

Clark et al. (2010) Child abuse and other traumatic experiences... Journal of Pediatric Psychology 35(5), 499-510

## Culture & Environment: Area Deprivation Index (ADI )

Geocoding from residential history (multiple residences)  
17 census measures: weighted sum (V1 primary residence here)

Characteristics determined for area residences

- housing [multiple indicators: e.g., without complete plumbing]
- income / below poverty threshold [multiple indicators]
- occupation/employment status [multiple indicators]
- marital status; education

	GAMM <sup>1</sup> (n=4473)		
	F	p	$\Delta R^2$
ADI	19.5	p<.001	0.4%

ABCD NDA 2.0: DEAP GAMM: Fixed Effects: age/sex;  
Random Effects: family/site; Propensity weight: American Community Survey

Singh (2003) AJPH; Kind et al. (2014) Annals of Internal Medicine

## Neurocognition: Flanker (Yv1) x BDM (Yv2)

**NIH Toolbox Flanker:** youth at ABCD v1

NIH Toolbox Cognition Battery: Executive Function

Construct: inhibitory control and attention

Task: indicate left-right orientation of central stimulus

inhibit attention to incongruent surrounding stimuli

	GAMM <sup>1</sup> (n=4440)		
	F	p	$\Delta R^2$
Flanker task	0.9	.38	0.0%

Zelazo et al. (2014) J Int Neuropsychol Soc

1. ABCD NDA 2.0: DEAP GAMM: flanker task (age corrected)

Fixed Effects: age/sex/race/ethnicity/income/marital status

Random Effects: family/site

Propensity weight: American Community Survey

## Physical Health: TBI (Pv1) x BDM (Yv2)

Ohio State Traumatic Brain Injury: parent at ABCD v1

		n (11,870)	%
TBI worst:	improbable	11,414	96
	possible	322	3
	mild	127	1
	moderate	4	.03
	severe	3	.03

	GAMM <sup>1</sup> (n=4479)		
	F	p	$\Delta R^2$
TBI worst	0.9	.43	0.0%

Bogner et al. (2017) J Head Trauma Rehabil

1. ABCD NDA 2.0: DEAP GAMM:

Fixed Effects: age/sex/race/ethnicity/income/marital status

Random Effects: family/site

Propensity weight: American Community Survey

# Summary

TBI in ABCD sample

**Future research** scale development  
BDM – brain development  
developmental outcomes  
criminal behavior  
victimization  
victimization effects

Data used in the preparation of this article were obtained from the Adolescent Brain Cognitive Development (ABCD) Study (<https://abcdstudy.org>), held in the NIMH Data Archive (NDA). This is a multisite, longitudinal study designed to recruit more than 10,000 children aged 9-10 years and follow them over 10 years into early adulthood. The ABCD Study is supported by the National Institutes of Health and additional federal partners under award numbers U01DA041022, U01DA041025, U01DA041028, U01DA041048, U01DA041089, U01DA041106, U01DA041117, U01DA041120, U01DA041134, U01DA041148, U01DA041156, U01DA041174, U01DA041093, U24DA041123, and U24DA041147. A full list of supporters is available at <https://abcdstudy.org/nih-collaborators>. A listing of participating sites and a complete listing of the study investigators can be found at <https://abcdstudy.org/principal-investigators.html>. ABCD consortium investigators designed and implemented the study and/or provided data but did not necessarily participate in analysis or writing of this report. This manuscript reflects the views of the authors and may not reflect the opinions or views of the NIH or ABCD consortium investigators. The ABCD data repository grows and changes over time. The ABCD data used in this report came from the ABCD Data Release 2.0 (DOI: 10.15154/1503209, March 2019) and ABCD Fix Release 2.0.1 (DOI: 10.15154/1504041, July 2019), and ABCD Data Release 3.0 (DOI: 10.15154/1519007).

# The ABCD- Social Development Study

Supported by The National Institute of Justice and the Centers for Disease Control and Prevention

Presenter:

Lia Ahonen, Ph.D,  
Department of Psychiatry  
University of Pittsburgh

# Acknowledgements

- ▶ This presentation is done in collaboration with Duncan B. Clark, Douglas Fitzgerald, & Kaylee Klingensmith.
- ▶ Investigators and staff of the data collection sites.
- ▶ Dr. Rolf Loeber who designed the SD Study together with Dr. Ahonen in 2014.
- ▶ Dr. David Farrington, Dr. Kevin Conway, Dr. Finn-Age Esbensen, Dr. Brant Hasler, Dr. Rick Rosenfeldt, & Dr. Helene Raskin-White for their initial support and guidance.

# Participating ABCD-SD Sites & Faculty; NIJ & CDC support

- ▶ **Site**      **Faculty**
- ▶ Pittsburgh    Clark [PI], Ahonen [Co-PI]
- ▶ Michigan     Hicks [SPI], Heitzeg, Hyde, Zucker
- ▶ Maryland     Chang [SPI], Cloak
- ▶ Florida       Cottler [SPI], Striley, Gurka
- ▶ Yale           Casey, Baskin-Sommers: [Co-SPIs]
- ▶ **Scientific officers**
- ▶ NIJ            Barbara Tatem Kelly
- ▶ CDC           Chris Harper

# Description of the Study

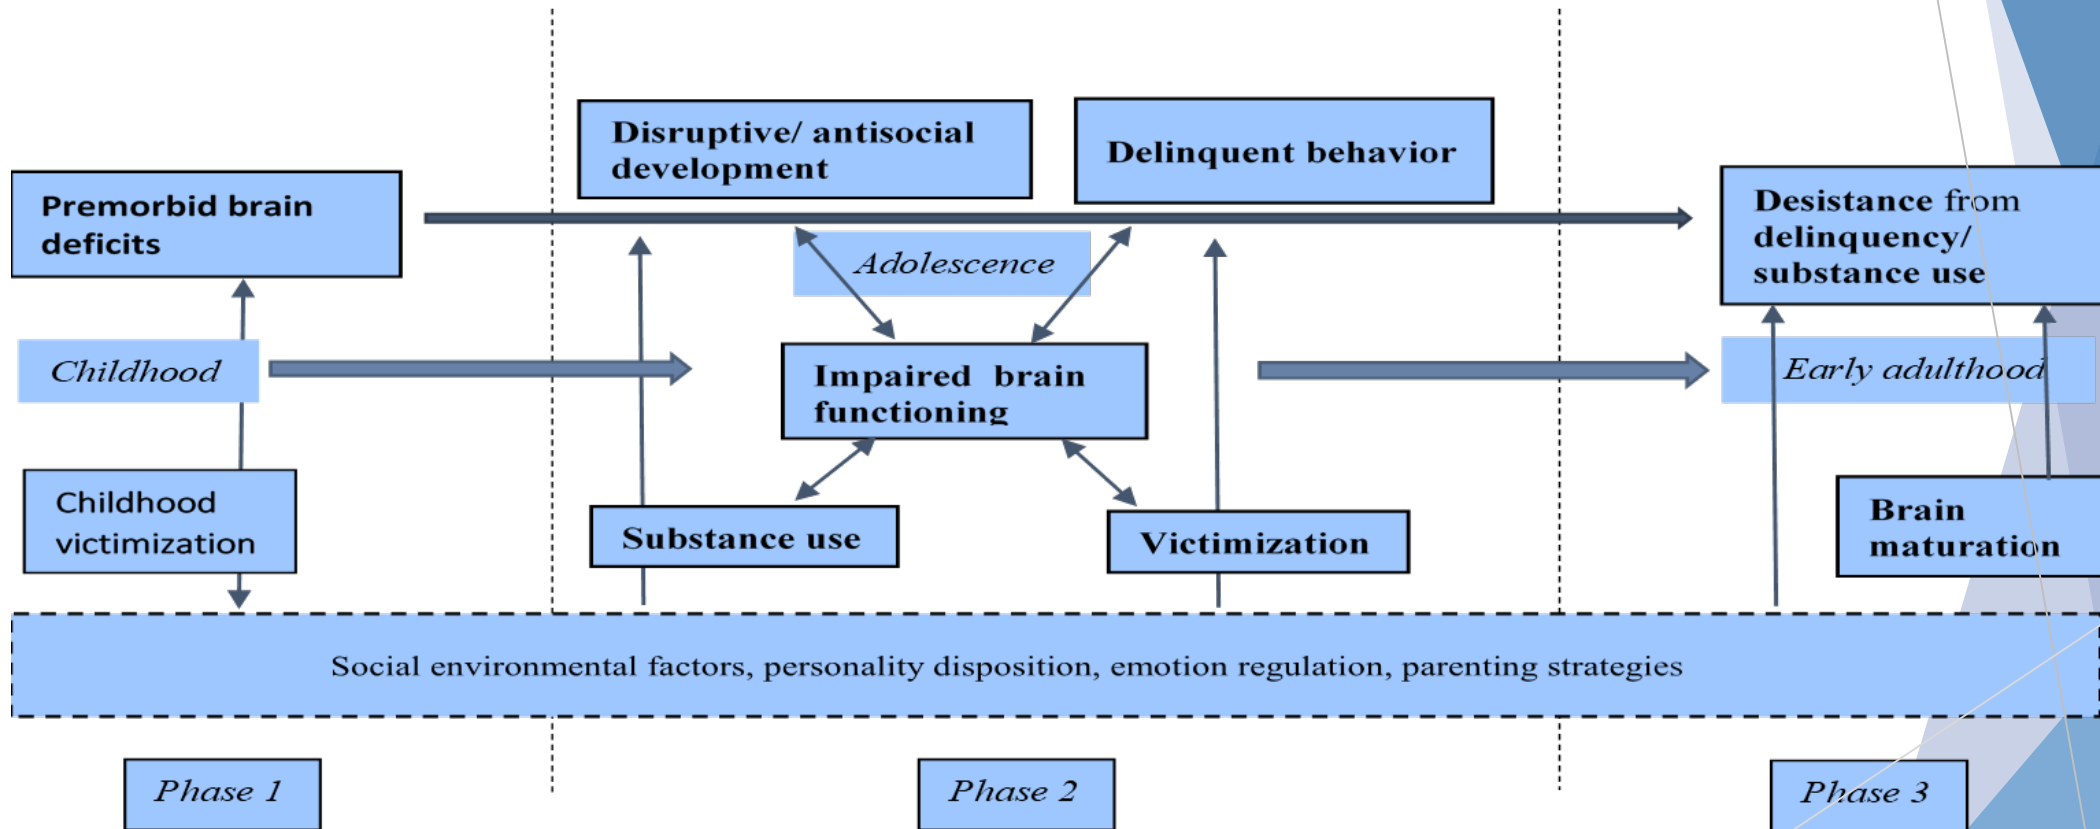

- ▶ Up to 2500 participants
- ▶ Age at first in person assessment: 10-12 (baseline)
- ▶ Planned annual assessments over 10 years
- ▶ Main constructs:
  - ▶ Delinquency
  - ▶ Victimization
  - ▶ Protective factors

# Aims of the ABCD-SD study

- ▶ 1. Examine the extent to which premorbid brain structure and function deficits, expressed through neurocognitive and executive dysfunction, identify vulnerabilities for delinquency and substance use.
- ▶ 2. Investigate the adverse effects of substance use trajectories on adolescent brain and cognitive development, and whether neurodevelopmental deficits are implicated in the onset and persistence of delinquent acts, as well as the probability of victimization.
- ▶ 3. Investigate brain maturation and its associations with early forms of desistance from delinquency and cessation of victimization.

# Conceptual model

Figure 1. Key elements of the ABCD-SD Study.

# The assessment protocol

Was carefully developed in close collaboration with the National Institute of Justice, and Centers for Disease Control and Prevention, and all the site faculty and investigators.

The protocol is dynamic and revised annually to collect high priority data that complement the parent study, without being redundant and burdensome for the participants.

# The assessment protocol

Child assessment			Parent assessment	
Instrument	Constructs	Items	Instrument	Items
Self-reported delinquency	Property crime, Violence, Internet Harassment, Police Contact	50	Parent-reported delinquency	50
Firearm carrying and access (YRBS)	Firearm access, safety	3	Firearm safety (BRFSS)	3
Victimization (JVQ)	Conventional crime, Peer and Sibling Victimization, Peer Aggression, Witnessing and Indirect Victimization, Gun Violence, School Violence and threat, Internet Victimization	32	Victimization (JVQ-P)	32
Youth Psychopathy Inventory (YPI)	Psychopathy	50	Not applicable	
CADS	Prosociality	12	CADS	12
ICU	Callous unemotional traits	17	ICU	17
Fear trait (TFQ-20)	Fearlessness	20	Not applicable	N/A
Aggression	Pro-, reactive aggression	23	Pro-, reactive aggression	23
Peer behavior profile	Peer negative and positive behavior	17	Not applicable	N/A
Emotion regulation (DERS)	Emotion regulation	36	Emotion regulation (DERS)	36
Alabama Parenting Questionnaire	Parenting	42	Parenting	42
Neighborhood Efficacy, Neighborhood disorder	Not applicable	N/A	CE-SC Scale, PND	10+15

A selection of  
the first  
descriptive  
data from  
baseline

# Demographics of the sample

Social Development Study (First half of the baseline sample, n=989)	
Average age at SD baseline in years (child)	10.8
Male %	51
White %	40.6
ABCD High Risk for Marijuana use% (int. & ext).	40.5
Biological mother %	84.9
Caregiver informant age (years)	38.85 (median 38.0)
Caregiver BA degree or higher %	23.1
No High School Diploma %	7.5
Median total household income	\$ 50- 75 000
Families reporting income < poverty line ( 2019, 2 adults, 2 children) %	26.4

# SD Demographics compared to national statistics 2019.

- ▶ In comparison, the gender distribution of the SD Study and the national census survey corresponds perfectly (51% male).
- ▶ Slightly smaller proportion of white children (40.6%) compared to the national average (50%).
- ▶ The total median household income (\$50-75,000) is similar to the national average (\$68,703), but lower than the national average for households with children (\$78,000).
- ▶ More than a quarter of the SD families (26.4%) reported incomes under the poverty line as compared to the national figures (10.5%) (4 people, \$25,926).

**Data Source:** Population Division, U.S. Census Bureau: The Annie Casey Foundation Kids Count Data center.

# Prevalence delinquency (child/parent report)

Any Delinquency % (SD combined parent/child report)						
						SD Total signif. † Chi-sq
Vandalism		31.3%	23.5%	43.9%	29.5%	< 0.001
Theft		19.9%	23.1%	43.3%	26.2%	< 0.001
Violence		76.0%	74.3%	87.3%	66.4%	0.001
Police Contact		4.5%	3.3%	14.6%	2.7%	< 0.001
Hidden Weapon Carrying						

# Prevalence victimization (child/parent)

Any Victimization % (SD combined parent/child report)							
	Florida (n=130) %	Maryland (n=246) %	Michigan (n=307) %	Pittsburgh (n=157) %	Yale (n=149) %	SD Total <i>signif.</i> † Chi-sq	Total (N=989)
Conventional Crime	73.1%	67.5%	63.7%	70.1%	65.1%	0.3	67.1%
Peer & Sibling (physical) Victimization	86.2%	79.3%	86.9%	87.3%	73.8%	0.001	83.0%
Peer & Sibling (social) Intimidation	56.2%	51.6%	52.3%	55.4%	47.7%	0.6	52.4%
Witnessing /Indirect Victimization	60.0%	63.0%	40.5%	77.1%	49.7%	< 0.001	55.9%
Exposure to Gun Violence	0.8%	8.5%	2.9%	15.9%	2.7%	< 0.001	6.1%
School Violence and Threats	29.2%	22.4%	26.8%	30.6%	19.5%	0.1	25.5%
Internet Victimization	9.2%	9.8%	6.9%	13.5%	14.1%	0.08	10.0%

# Personality features

- ▶ We do know that callous unemotional traits and psychopathic personality features are associated with delinquency.
- ▶ We don't know if, and to what extent, individual emotion regulation is associated with delinquency and victimization, and if emotion regulation is qualitatively distinct from psychopathic traits.
- ▶ In the SD study we are measuring both.

## Associations between delinquency and emotion regulation (ER)

ER ( worst quartile)	Any Moderate Theft	Any Serious Theft	Any Moderate Violence	Any Serious Violence
Difficulties in ER (Full scale)	0.14**	0.13**	0.12**	0.21**
Non-acceptance of emotional responses	0.11**	0.11**	<i>ns</i>	0.11**
Non goal directed behavior	0.07*	<i>ns</i>	0.08*	0.10**
Impulse control diff.	0.14**	0.08*	0.15**	0.26**
Lack of emotional awareness	0.06*	<i>ns</i>	<i>ns</i>	0.12**
Lack of ER strategies	0.13**	0.12**	0.10*	0.17**
Lack of emotional clarity	0.12**	0.16**	0.10*	0.11**

Note: \*\*  $p < .001$ , \*  $p < .05$  Kendall's Tau b.

Delinquency= self and parent reported best estimate

Emotion regulation= self reported, worst quartile= 25% highest score.

## Associations between victimization and emotion regulation

	Any victimization					
	<u>Conventional crime</u>	<u>Peer or sibling</u>				
		<i>ns</i>	0.10*	0.11**	0.08*	0.07*
Non-acceptance of emotional responses		<i>ns</i>	0.10*	0.12**		
Non goal directed behavior		0.11**	0.13**	0.07*		<i>ns</i>
Impulse control diff.		0.09*	0.14**	0.12**		0.12**
Lack of emotional awareness		<i>ns</i>	-0.09*	<i>ns</i>		<i>ns</i>
Lack of ER strategies						0.09*
Lack of emotional clarity	0.10*	<i>ns</i>	<i>ns</i>	0.07*	<i>ns</i>	0.05*

Note: \*\*  $p < .001$ , \*  $p < .05$  Kendall's Tau b.

Victimization= self and parent reported best estimate, Emotion regulation= self reported, worst quartile= 25% highest score.

## Associations between emotion regulation and the YPI

	The Youth Psychopathy Inventory (worst quartile)		
Difficulties in ER (Full scale)			
Non-acceptance of emotional responses	0.15**	0.18**	0.19**
Non goal directed behavior	0.13**	ns	
Impulse control diff.	0.24**	0.22**	
Lack of emotional awareness	0.12**		
Lack of ER strategies	0.22**		0.27**
Lack of emotional clarity			0.12**

Note: \*\*  $p < .001$ , \*  $p < .05$  Kendall's Tau b.

ER & YPI= self reports, worst quartile= 25% highest score.

# Conclusions

- ▶ The ABCD-SD Study is a unique development of the merging of life course criminology and neurodevelopment.
- ▶ The overall sample will be a decent representation of the national group of children in the overall population, with a slight skewness towards high risk and low socio-economic status.
- ▶ Personality features such as psychopathic traits are well known as a precursor of delinquency, but also emotion regulation plays an important role.
- ▶ There are important differences between data collection sites that need consideration in future analyses.

# A word of caution

- ▶ The results should be used with caution. Data should not be used out of context.
- ▶ For example, there are significant differences in race in prevalence, and frequency, of delinquency as well as victimization.
- ▶ Previous studies have shown that race is not a significant independent precursor of, for example, violence, when other environmental factors were taken into account.
- ▶ The SD assessment protocol is revised annually to better reflect social justice issues, and inclusiveness.

# The future

- ▶ This study has the potential to significantly contribute to our understanding of organic brain development and how this relates to delinquent or norm breaking behavior over time.
- ▶ We will learn about if, and how, early onset of Marijuana use affects both brain development and behavioral problems. This is crucial information in the current climate of legalization of Marijuana across nations.
- ▶ Data will be deposited with NIJ and the ABCD Consortium for public access.

# Final words

- ▶ This is the first study on brain development, delinquency, victimization and protective factors to date, with a large enough sample to differentiate race, gender, and other demographic factors.
- ▶ This is our opportunity to carry Rolf Loeber's legacy into the future, and to celebrate all the knowledge that he and Magda Stouthamer-Loeber have contributed through their long-term collaboration and organization of longitudinal studies.

Delinquency, victimization, and the developing brain:  
Results from the ABCD-Social Development study

# A neurodevelopmental approach to understanding the emergence and persistence of delinquency behaviors

Ashley C. Parr, PhD

Laboratory of Neurocognitive Development (LNCD), University of Pittsburgh

# Roadmap

- Adolescence is a period of heightened plasticity, and a period of vulnerability to the emergence of delinquency and exposure to victimization
  - But also a window of opportunity for rehabilitation

# Roadmap

- Adolescence is a period of heightened plasticity, and a period of vulnerability to the emergence of delinquency and exposure to victimization
  - But also a window of opportunity for rehabilitation
- Changes in the brain during adolescence contribute to a normative peak in impulsive sensation seeking

# Roadmap

- Adolescence is a period of heightened plasticity, and a period of vulnerability to the emergence of delinquency and exposure to victimization
  - But also a window of opportunity for rehabilitation
- Changes in the brain during adolescence contribute to a normative peak in impulsive sensation seeking
- Differences in brain function may confer risk for delinquency and victimization behaviors in adolescence
  - Dopamine: The main neurotransmitter underlying reward
  - Tissue-iron: dopamine imaging using magnetic resonance imaging (MRI)
  - Sex differences

# Examples of vulnerabilities in adolescence

- Peak in sensation seeking that can lead to risk-taking behaviors
- Present across societies and species - ***Adaptive period to acquire skills needed to survive as an independent adult (exploration, experience-dependent plasticity)***
- Despite peak physical health, there is a twofold increase in mortality (Dahl, 2004) - *substance use, unprotected sex, extreme sports, suicide*

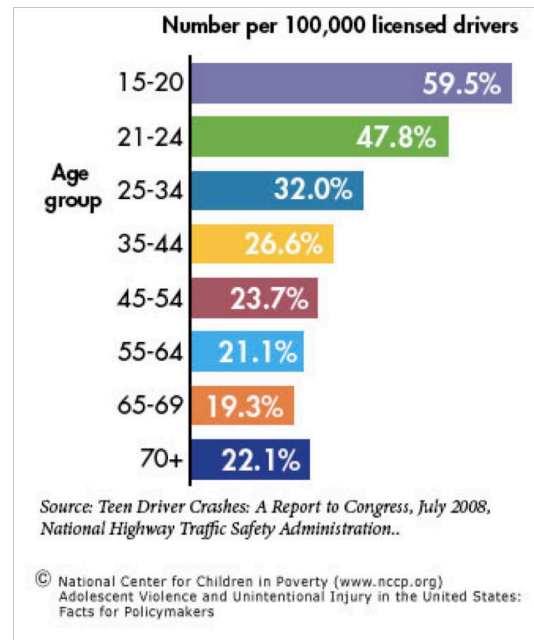

**Substance use initiation**

# Dopamine and development

## Striatum systems

*Reward processing*

Elevated in adolescence  
(Galvan et al., 2006; Geier et al., 2009)

# Dopamine and development

## Striatum systems

### Reward processing

Striatum

Elevated in adolescence  
(Galvan et al., 2006; Geier et al., 2009)

Dopamine: the main neurotransmitter  
underlying reward function

- ***Imaging dopamine in human adolescence has been limited by restrictions on the use of PET in pediatric populations***

# Dopamine and development

## Striatum systems

### Reward processing

Striatum

Elevated in adolescence  
(Galvan et al., 2006; Geier et al., 2009)

Dopamine: the main neurotransmitter  
underlying reward function

## Dopamine availability across development

- ***Imaging dopamine in human adolescence has been limited by restrictions on the use of PET in pediatric populations***

# Dopamine and development

## Striatum systems

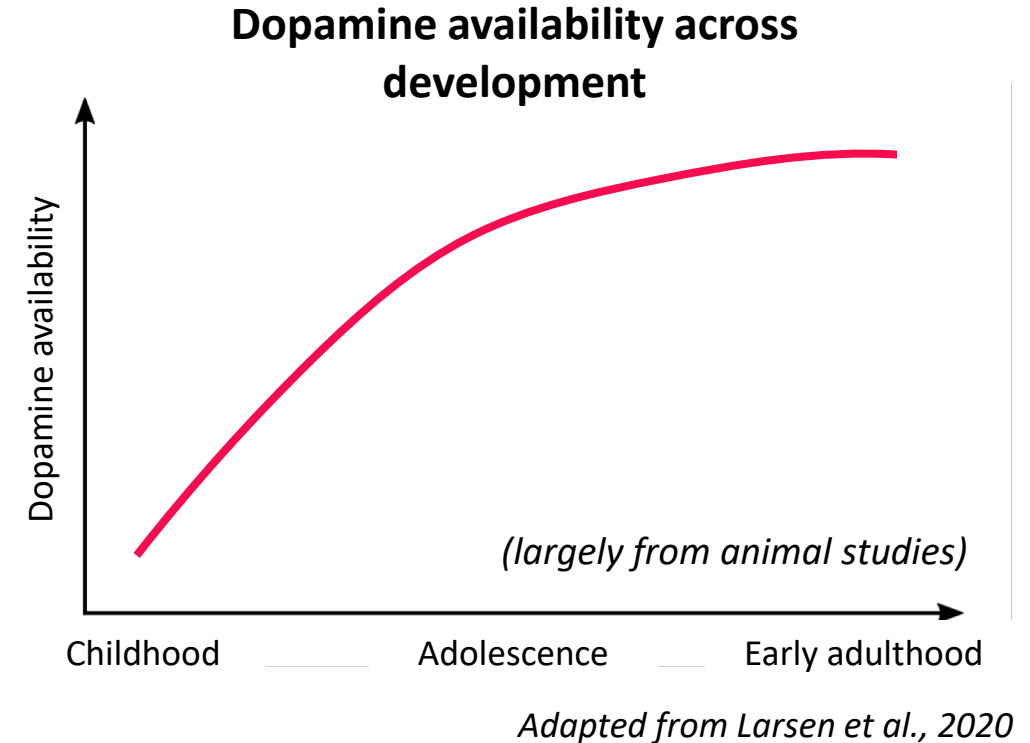

### Reward processing

Elevated in adolescence  
(Galvan et al., 2006; Geier et al., 2009)

Dopamine: the main neurotransmitter  
underlying reward function

- ***Imaging dopamine in human adolescence has been limited by restrictions on the use of PET in pediatric populations***
- ***Addressing these limitations, we use brain tissue iron (Ferritin), which is critical for dopamine production, is concentrated in the striatum, and can be measured non-invasively using MRI*** (Ortega et al., 2007; Zucca et al., 2017; Connor et al., 1996; Ward et al., 2014)

# Tissue-iron as a marker for dopamine availability

Adolescent sample: N=177, 12-31 YO (1-3 visits each)

*Parr et al., 2020, in revision*

***Tissue iron concentration increases through adolescence, stabilizing into adulthood.***

# Tissue-iron as a marker for dopamine availability

Adolescent sample: N=177, 12-31 YO (1-3 visits each)

*Parr et al., 2020, in revision*

***Tissue iron concentration increases through adolescence, stabilizing into adulthood.***

# Tissue-iron as a marker of dopamine availability

Adolescent sample: N=177, 12-31 YO (1-3 visits each)

*Parr et al., 2020, in revision*

Adult sample: n=80, 18-30 YO (1-2 visits each)

*Larsen et al., 2020*

***Tissue iron concentration increases through adolescence, stabilizing into adulthood.  
Tissue iron corresponds most closely to indices of dopamine availability.***

# Dopamine and development: brain circuitry

- We have recently shown that striatum dopamine (tissue iron) mediates developmental changes in brain connectivity, including communication between the prefrontal cortex and the striatum, which is heightened in adolescents (Parr et al., *in revision*)

# Dopamine and development: brain circuitry

- We have recently shown that striatum dopamine (tissue iron) mediates developmental changes in brain connectivity, including communication between the prefrontal cortex and the striatum, which is heightened in adolescents (Parr et al., *in revision*)
- Increased dopamine function in adolescence, coupled with increased communication between the PFC and the striatum, may reflect a mechanism underlying sensation seeking

# Dopamine and development: brain circuitry

- We have recently shown that striatum dopamine (tissue iron) mediates developmental changes in brain connectivity, including communication between the prefrontal cortex and the striatum, which is heightened in adolescents (Parr et al., *in revision*)
- Increased dopamine function in adolescence, coupled with increased communication between the PFC and the striatum, may reflect a mechanism underlying sensation seeking
- Decreases into adulthood may reflect decreased influence of reward (dopamine and striatum) on prefrontal cortex cognitive function

# Dopamine and development: brain circuitry

- We have recently shown that striatum dopamine (tissue iron) mediates developmental changes in brain connectivity, including communication between the prefrontal cortex and the striatum, which is heightened in adolescents (Parr et al., *in revision*)
- Increased dopamine function in adolescence, coupled with increased communication between the PFC and the striatum, may reflect a mechanism underlying sensation seeking
- Decreases into adulthood may reflect decreased influence of reward (dopamine and striatum) on prefrontal cortex cognitive function
- ***Hypothesis: Abnormally elevated dopamine function may lead to exacerbated sensation seeking behaviors, reflected as delinquency***

# Does brain function and maturation predict delinquency?

**1. Does brain function predict the onset of delinquency and victimization?**

*Late childhood  
(9-11 years-old)*

**2. Do brain maturation processes in adolescence predict delinquency and desistance?**

*Adolescence  
(12-17 years-old)*

**3. Do adolescent behaviors interact with the environment and impact brain maturation itself?**

*Early adulthood  
(18-19 years-old)*

**Emergence**

**Potential escalation**

**Persistence or desistance**

# Methods: The ABCD-SD dataset

- Wave 1: Baseline data
  - 586 participants (285 f, age range, 9-11)
  - Balanced for sex and across ethnicities

# Methods: The ABCD-SD dataset

- Wave 1: Baseline data
  - 586 participants (285 f, age range, 9-11)
  - Balanced for sex and across ethnicities
- Striatal tissue iron

# Methods: The ABCD-SD dataset

- Wave 1: Baseline data
  - 586 participants (285 f, age range, 9-11)
  - Balanced for sex and across ethnicities
- Striatal tissue iron
- ABCD-SD measures of delinquency, victimization, personality characteristics (prosociality, callous unemotional traits), psychopathy (YPI), emotional regulation (DERS), and demographic factors (parental education)

# Methods: The ABCD-SD dataset

- Wave 1: Baseline data
  - 586 participants (285 f, age range, 9-11)
  - Balanced for sex and across ethnicities
- Striatal tissue iron
- ABCD-SD measures of delinquency, victimization, personality characteristics (prosociality, callous unemotional traits), psychopathy (YPI), emotional regulation (DERS), and demographic factors (parental education)
- Linear models (LM) included age, sex, and parental education as covariates and tested for interactions with sex

# **Initial Findings: Tissue-iron distributions**

# Males have higher tissue iron as compared to females

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

*Consistent with Persson et al., 2015 & Bartzokis et al., 2007, but see Peterson et al., 2018*

# Males have higher tissue iron as compared to females

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

$t = -7.62, p < .001, \text{Cohen's } D = .32$

*Consistent with Persson et al., 2015 & Bartzokis et al., 2007, but see Peterson et al., 2018*

**Initial Findings:**  
**Associations between high-risk  
characteristics and tissue iron across genders**

In **males**, **lower** striatal tissue iron is associated with **increased** delinquency, psychopathy, and fearlessness

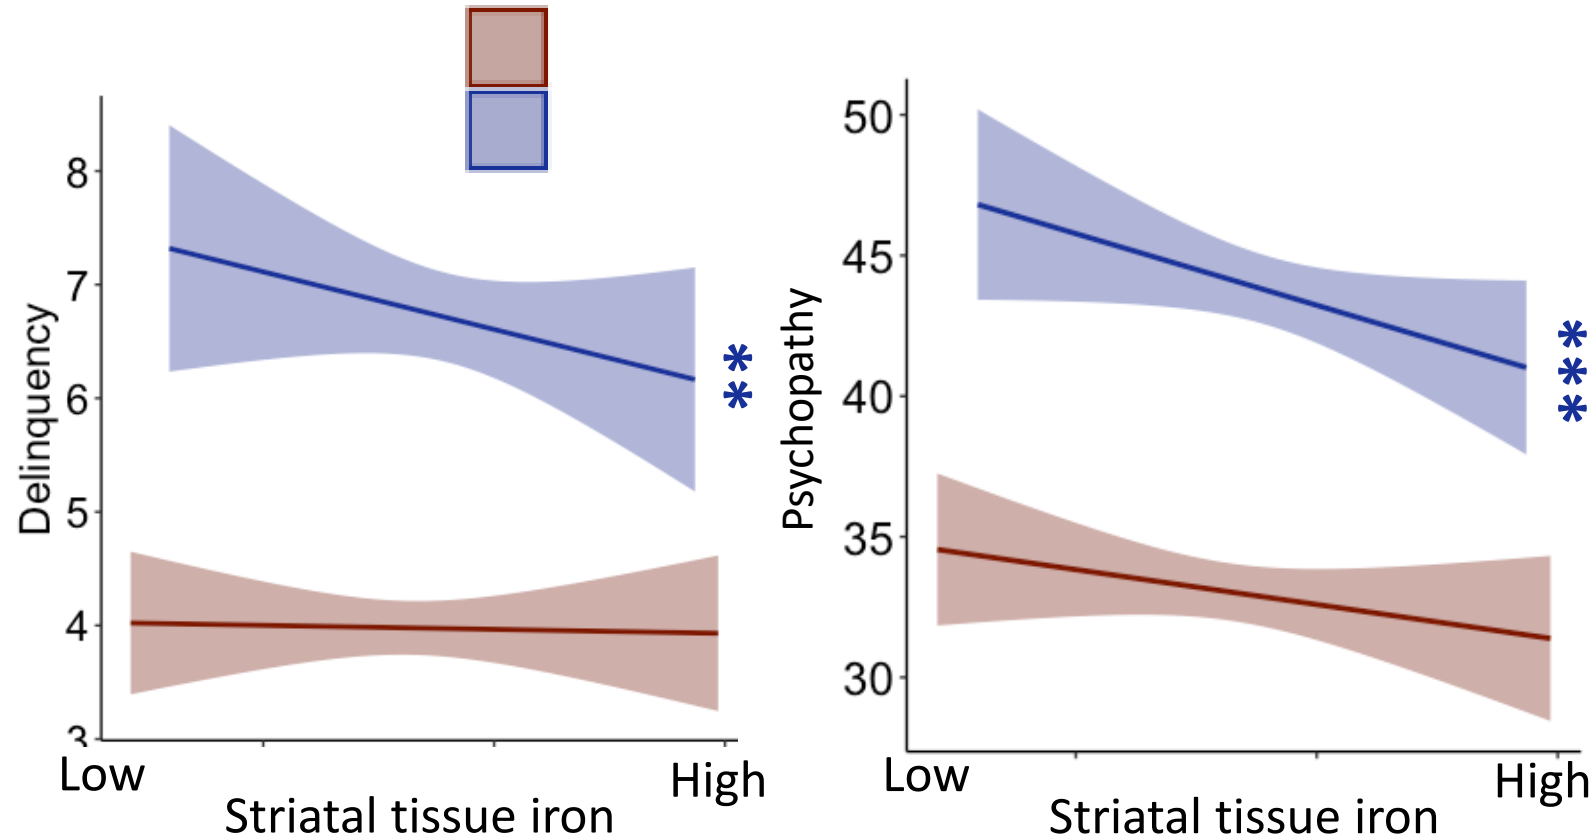

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

\*Vertical axes reflect higher scores on the instruments used to measure each construct

In **males**, **lower** striatal tissue iron is associated with **increased** delinquency, psychopathy, and fearlessness

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

\*Vertical axes reflect higher scores on the instruments used to measure each construct

In **males**, **lower** striatal tissue iron is associated with **increased** delinquency, psychopathy, and fearlessness. No associations found here for **females**.

\*Vertical axes reflect higher scores on the instruments used to measure each construct

In **females**, **higher** striatal tissue iron is associated with **increased** aggression, victimization, and difficulties in emotional regulation

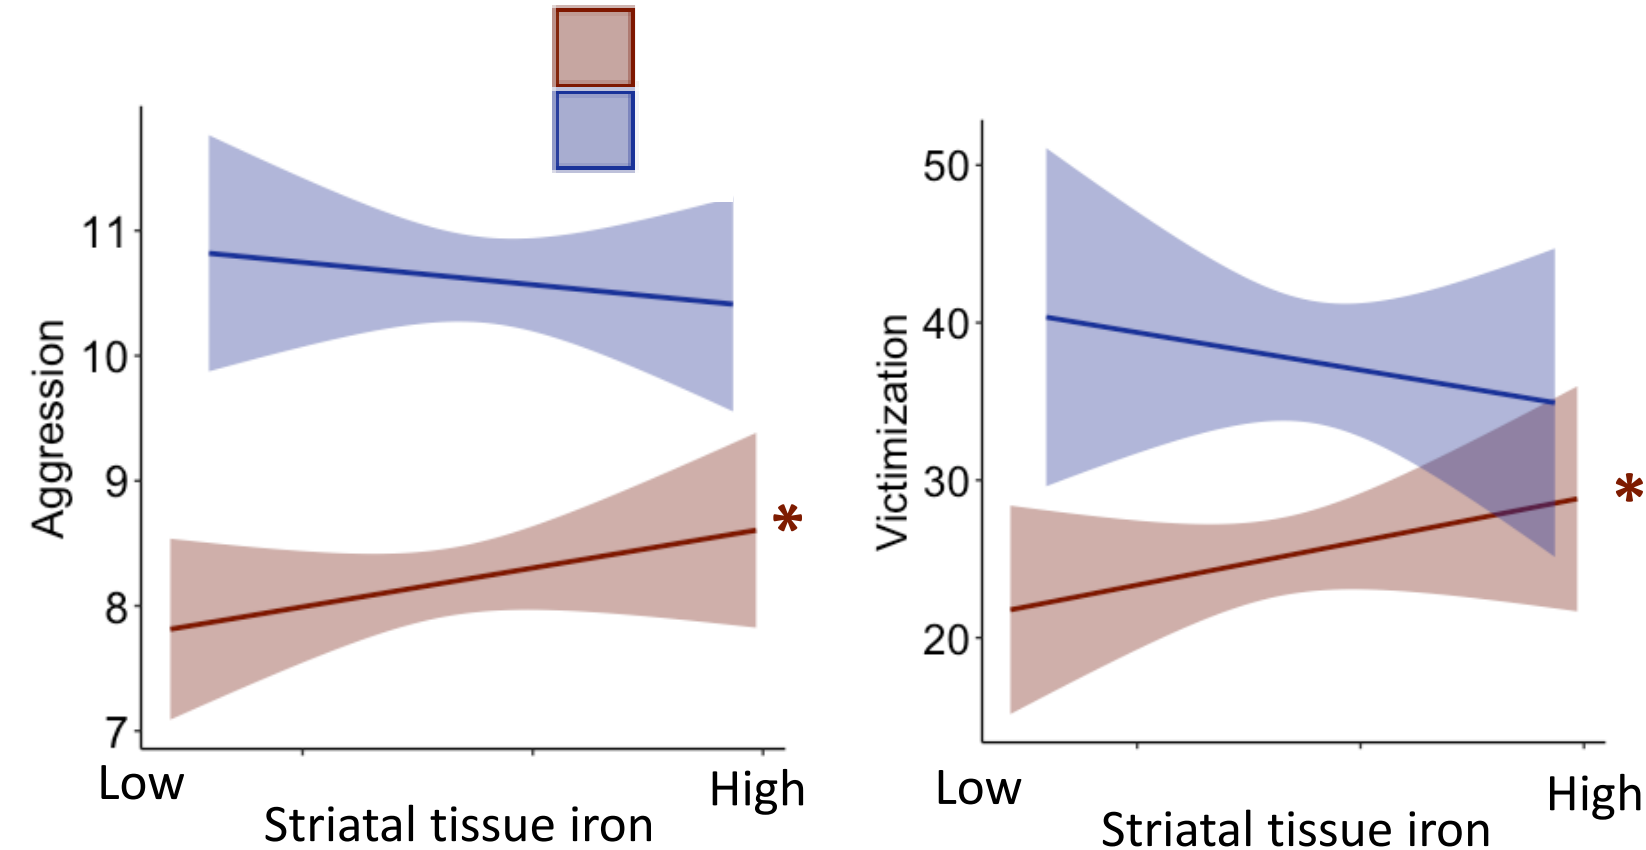

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

\*Vertical axes reflect higher scores on the instruments used to measure each construct

In **females**, **higher** striatal tissue iron is associated with **increased** aggression, victimization, and difficulties in emotional regulation

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

\*Vertical axes reflect higher scores on the instruments used to measure each construct

In **females**, **higher** striatal tissue iron is associated with **increased** aggression, victimization, and difficulties in emotional regulation. No associations found here for **males**.

\*  $p < .05$   
\*\*  $p < .01$   
\*\*\*  $p < .001$

\*Vertical axes reflect higher scores on the instruments used to measure each construct

# Variation in striatal tissue iron, reflecting dopamine function, is associated with aspects of delinquency in late childhood

- **Males** endorse **more** high-risk behaviors (and traits), including delinquency

- **Females** endorse **less** high-risk behaviors (and traits), which may emerge later in development

# Variation in striatal tissue iron, reflecting dopamine function, is associated with aspects of delinquency in late childhood

- **Males** endorse **more** high-risk behaviors (and traits), including delinquency
- In **males**, **less** tissue iron corresponds to **higher risk** for:
  - Delinquency, fearlessness, and psychopathy

- **Females** endorse **less** high-risk behaviors (and traits), which may emerge later in development
- In **females**, **more** tissue iron corresponds to **higher risk** for:
  - Victimization, aggression, difficulties with emotion regulation

# Variation in striatal tissue iron, reflecting dopamine function, is associated with aspects of delinquency in late childhood

- **Males** endorse **more** high-risk behaviors (and traits), including delinquency
- In **males**, **less** tissue iron corresponds to **higher risk** for:
  - Delinquency, fearlessness, and psychopathy

*Though speculative, it is possible tissue iron plays an important role in **male delinquency**, and **female victimization**. Future work will interrogate the specificity of these associations*

- **Females** endorse **less** high-risk behaviors (and traits), which may emerge later in development
- In **females**, **more** tissue iron corresponds to **higher risk** for:
  - Victimization, aggression, difficulties with emotion regulation

# Planned analyses

- Predictive models will identify patterns among brain markers that correspond to different trajectories of high-risk behavior (i.e., adolescent-limited versus life-course persistent)

# Planned analyses

- Predictive models will identify patterns among brain markers that correspond to different trajectories of high-risk behavior (i.e., adolescent-limited versus life-course persistent)
- Longitudinal models (with future timepoints) will identify patterns among predisposing brain markers and deviations from normative development that lead to the persistence of high-risk behaviors

# Planned analyses

- Predictive models will identify patterns among brain markers that correspond to different trajectories of high-risk behavior (i.e., adolescent-specific versus life-course persistent)
- Longitudinal models (with future timepoints) will identify patterns among predisposing brain markers and deviations from normative development that lead to the persistence of high-risk behaviors
- The first of its kind ABCD-SD dataset will allow us to identify robust associations between brain, development, and the emergence, persistence, and desistance of delinquency and victimization

# Planned analyses

- Predictive models will identify patterns among brain markers that correspond to different trajectories of high-risk behavior (i.e., adolescent-specific versus life-course persistent)
- Longitudinal models (with future timepoints) will identify patterns among predisposing brain markers and deviations from normative development that lead to the persistence of high-risk behaviors
- The first of its kind ABCD-SD dataset will allow us to identify robust associations between brain, development, and the emergence, persistence, and desistance of delinquency and victimization
- Results from the ABCD-SD can inform how we intervene in the lives of high-risk youth, and how to better protect young people from victimization
  - Brain is amenable to change!
